

PriEx - Pro/INTRALINK export

Requirements

- To export files out of Pro/INTRALINK automatically in batch mode
- To provide Pro/ENGINEER objects and structures for the import to SAP:
 - To recognize and consider dependencies
 - To synchronize Pro/INTRALINK meta data with Pro/E parameters
 - To include drawings with a "where used" search
- Different export modes (as stored, revision and version, the last n versions, objects within a definable status)
- Definition of combined extraction criterias for the objects to be exported out of Pro/INTRALINK

Solution

PriEx is developed in Java and is based on an own database. To access Pro/INTRALINK the Pro/INTRALINK Toolkit functions are used. Within a special user interface extraction tasks can be defined. The objects which matches the search criteria are stored within the PriEx database. In the next step the single objects are exported. Using a Javascript options can be defined, which enhances for example the Pro/ENGINEER data with Pro/INTRALINK meta data in order to transfer these data to SAP PLM. In a last step the data can be imported to SAP using the automatically created import lists and import directories.

Advantages

- Based on a client-server architecture in combination with a database the complete migration process can be parallized
- User definable search options, e.g. search for folders, name patterns in combination with wildcards
- Different and combinable export modes (as stored, revision and version, the last n versions, objects within a definable status) are available
- Easily definable rules for the meta data export out of Pro/INTRALINK using Javascript

Procedure

- Together with the customer our consultants define the Pro/INTRALINK export process
- PriEx will be installed and configured based on the customer needs
- The export of the files can be done by the customer himself or together with our consultants
